Overview

Introduction

2 The Setup

3 Free Trade Regime

- LP vs. UE
- Proposition 1
- Proposition 2

Trade Policy Intervention

- Proposition 3
- Proposition 4

5 Concluding Remarks

Patents are not ironclad

The number of patent disputes has grown dramatically in recent decades

Approximately 46% of all litigated patents are found to be invalid

Allison and Lemley (1998), Lanjouw and Schankerman(2002), Shapiro (2003), Weatherall and Webster (2014), ...

Damage awards in patent litigation has two purposes

- 1. Deter infringement
- 2. Compensate the patent holder (i.e., the damaged party)

Damage Rules:

- 1. Unjust Enrichment (UE) rule
- 2. Lost Profits (LP) rule

Schankerman and Scotchmer (2001 RAND) – Vertical relationship Anton and Yao(2003 JEMS, 2007 JLEO) – Non drastic innovation Choi (2009, IEP) – Closed economy

Surveys: Lemley and Shapiro (2005, JEP) and Weatherall and Webster (2014, JES)

Firm 1

- Product patent holder (or, Patentee of a specific technology)
- Located in country F
- Cost function: $C_1 = C_1(q_1)$

Firm 2

- Potential competitor/infringer
- Located in country H
- Cost function: $C_2 = C_2(q_2)$

The product is sold only in country H

Market demand function: p = p(Q), $Q = q_1 + q_2$.

Assumptions

A1: p'(Q) < 0 and $p''(Q) \le 0$.

A2:
$$C_i(0) = 0, \ 0 \leq C_1'(q_1) \leq C_2'(q_2)$$
 and $C_1''(q_1) = C_2''(q_2) = 0.$

< 🗗 🕨

э

$\frac{\text{No Infringement}}{\text{Firm 1 is the monopolist}} \\ (\pi_1^M)$

Infringement

Cournot quantity competition

$$[(A1) \text{ and } (A2)] \ \Rightarrow \pi_1(q_1,q_2) + \pi_2(q_1,q_2) < \pi_1^M$$

Enforcement of the IPR is uncertain

An act of patent infringement can be proved in the court of law with probability α (0 < α < 1), which is assumed to be common knowledge.

Damage Rules

Unjust Enrichment (*UE*) rule: $D^{UE} = \pi_2(q_1, q_2)$ Lost Profit (*LP*) rule: $D^{LP} = \pi_1^M - \pi_1(q_1, q_2)$

A general form of Damage Rule

$$D^{Gen} = heta D^{UE} + (1 - heta) D^{LP}$$
, where $0 \le heta \le 1$.
 $heta = 0 \Rightarrow D^{Gen} = D^{LP}$
 $heta = 1 \Rightarrow D^{Gen} = D^{UE}$

Firm 2 infringes the patent

Stages of the game

Stage 1: Firm 1 and Firm 2 engage in Cournot quantity competition in the product market.

Stage 2: Firm 1 files a lawsuit of patent infringement against firm 2, the court of law pronounces judgment and the dispute is settled in the court.

Free Trade Regime ...

Problem of firm 1

$$\begin{aligned} & \underset{q_1}{\text{Max}} \ O_1 = \pi_1(q_1, q_2) + \alpha D^{Gen} \\ & = (1 - \alpha + \alpha \theta) \pi_1(q_1, q_2) + \alpha \theta \pi_2(q_1, q_2) + \alpha (1 - \theta) \pi_1^M \end{aligned}$$

$\theta = 0$ (LP)

$$O_1 = (1 - \alpha)\pi_1(q_1, q_2) + \alpha \pi_1^M \Rightarrow \operatorname{ArgMax}_{q_1} O_1(q_1, q_2) = \operatorname{ArgMax}_{q_1} \pi_1(q_1, q_2)$$

$\theta = 1 (UE)$

$$O_1 = \pi_1(q_1, q_2) + lpha \pi_2(q_1, q_2) \Rightarrow \mathop{\operatorname{ArgMax}}_{q_1} O_1(q_1, q_2) < \mathop{\operatorname{ArgMax}}_{q_1} \pi_1(q_1, q_2)$$

Collusive Behavior

æ

Image: A match a ma

Free Trade Regime ...

Problem of firm 2

$$\begin{split} & \underset{q_2}{\text{Max}} \ O_2 = \pi_2(q_1, q_2) - \alpha D^{\text{Gen}} \\ & = (1 - \alpha \theta) \pi_2(q_1, q_2) + \alpha (1 - \theta) \pi_1(q_1, q_2) - \alpha (1 - \theta) \pi_1^M \end{split}$$

$\theta = 0 (LP)$

$$O_2 = \pi_2(q_1, q_2) + \alpha \pi_1(q_1, q_2) - \alpha \pi_1^M$$
 Collusive Behavior

$$\Rightarrow \operatorname{ArgMax}_{q_2} O_2(q_1, q_2) < \operatorname{ArgMax}_{q_2} \pi_2(q_1, q_2)$$

$\theta = 1 (UE)$

$$O_2 = (1 - \alpha)\pi_2(q_1, q_2) \Rightarrow \underset{q_2}{\operatorname{ArgMax}} O_2(q_1, q_2) = \underset{q_2}{\operatorname{ArgMax}} \pi_2(q_1, q_2)$$

LP Rule ($\theta = 0$)

- Firm 1 is non-collusive (Aggressive)
- Firm 2 is collusive

$$\Rightarrow q_1^{LP} > q_1^{NoIPR}$$
, $q_2^{LP} < q_2^{NoIPR}$

UE Rule ($\theta = 1$)

- Firm 1 is collusive
- Firm 2 is non-collusive (Aggressive)

$$\Rightarrow q_1^{\textit{UE}} < q_1^{\textit{NoIPR}}, \ q_2^{\textit{UE}} > q_2^{\textit{NoIPR}}$$

3

Free Trade Regime ...

Illustration (Contd..)

Figure: Equilibrium Analysis

Dey, Kabiraj and Pal || IGIDR

IPR, Damage Rule & Trade Policy

March 15, 2016 17 / 34

Lemma 1

 $\frac{\partial q_1^F(\theta)}{\partial \theta} < 0, \ \frac{\partial q_2^F(\theta)}{\partial \theta} > 0 \ \text{and} \ \frac{\partial [q_1^F(\theta) + q_2^F(\theta)]}{\partial \theta} \ge 0 \ \forall \ \theta \in [0,1], \text{ where the sign of equality holds in the case of } C_1' = C_2'.$

It implies that

$$q_{1,LP}^{F} > q_{1,UE}^{F}, \ q_{2,LP}^{F} < q_{2,UE}^{F} \ \text{and} \ q_{1,LP}^{F} + q_{2,LP}^{F} \le q_{1,UE}^{F} + q_{2,UE}^{F}.$$

Lemma 2

$$\begin{split} & \frac{dO_1^F(\theta)}{d\theta} < 0 \text{ and } \frac{dO_2^F(\theta)}{d\theta} > 0, \, \forall \, \theta \in [0,1]. \\ & \text{It implies that } O_{1,LP}^F > O_{1,UE}^F \text{ and } O_{2,LP}^F < O_{2,UE}^F \end{split}$$

3

Will there be infringement?

Yes, if
$$O_2^F > 0 \Rightarrow \alpha < \frac{\pi_2^F}{(\pi_1^M - \pi_1^F) - \theta(\pi_1^M - \pi_1^F - \pi_2^F)} = \bar{\alpha}(\theta).$$

•
$$\bar{lpha}(heta) > 0$$
 and $rac{\partial \bar{lpha}(heta)}{\partial heta} > 0$

- $\bar{\alpha}(1) = 1$. So, $O_2^F > 0 \ \forall \ \alpha \in [0, 1]$. Under *UE* rule, firm 2 will always Infringe.
- *α*(0) < 1, since π₁^F + π₂^F < π₁^M. Under LP rule infringement may or may not occur.
 - If $\alpha < \bar{\alpha}(0)$, infringement occurs.
 - If $\alpha \geq \bar{\alpha}(0)$, infringement is deterred.

Proposition 1

In the regime of free trade, the patentee prefers the 'lost profit' damage rule the most, while the infringer prefers the 'unjust enrichment' damage rule the most, over any convex combination of the 'lost profit' damage rule and the 'unjust enrichment' damage rule.

Consumers' Surplus and Social Welfare of Country *H*: $CS^{F}(\theta) = \int_{0}^{Q^{F}(\theta)} p(Q)dQ - p(Q^{F}(\theta))Q^{F}(\theta)$ $SW^{F}(\theta) = CS^{F}(\theta) + O_{2}^{F}(\theta)$

Lemma 3

 $\frac{dCS^{F}(\theta)}{d\theta} \geq 0, \text{ where the sign of equality holds in the case of } C'_{1} = C'_{2}, \text{ and } \frac{dSW^{F}(\theta)}{d\theta} > 0, \forall \theta \in [0, 1].$

It implies that $CS_{LP}^F \leq CS_{UE}^F$ and $SW_{LP}^F < SW_{UE}^F$.

Proposition 2

In the regime of free trade, given the choice, **the government of the home country would always enforce the 'unjust enrichment' damage rule** to be followed in the court of law, which best protects interests of consumers and the infringer at the cost of the patentee.

Unilateral trade policy intervention by the importing country H

Let t be the per unit tariff on imports. t > 0 (t = 0) t < 0

Stages of the game

Stage 1: The government of country *H* imposes per unit import tariff *t*.

Stage 2: Firm 2 decides whether to infringe the patent or not. If infringement does not take place, firm 1 produces monopoly output and the game ends. Otherwise, if firm 2 infringes the patent, Cournot quantity competition between firm 1 and firm 2 takes place in the product market.

Stage 3: Firm 1 files a lawsuit of patent infringement against firm 2, the court of law pronounces judgment and the dispute is settled in the court.

Trade Policy Intervention ...

No Infringement: Firm 1 is the Monopolist

$$\max_{q_1} \tilde{\pi}_1 = p(q_1)q_1 - C_1(q_1) - tq_1$$

 $\frac{\partial q_1^M(t)}{\partial t} = \frac{1}{p^{\prime\prime}(q_1)q_1 + p^{\prime}} < 0$

$$M_{t} SW = \int_{0}^{q_{1}} p(q_{1})dq_{1} - p(q_{1})q_{1} + tq_{1}$$

subject to the constraint $q_{1} = q_{1}^{M}(t)$

 $t^{M,R} > 0$

Dey, Kabiraj and Pal || IGIDR

IPR, Damage Rule & Trade Policy

Infringement: Cournot Duopoly

$$\frac{\partial q_1^R(t;\theta)}{\partial t} < 0, \ \frac{\partial q_2^R(t;\theta)}{\partial t} > 0 \ \text{and} \ \frac{\partial [q_1^R(t;\theta) + q_1^R(t;\theta)]}{\partial t} < 0$$

$$M_{t}^{ax} SW = \left[\int_{0}^{Q} p(Q)dQ - p(Q)Q\right] + \tilde{O}_{2}(q_{1}, q_{2}, t; \theta) + tq_{1},$$

subject to the constraints
$$q_{1} = q_{1}^{R}(t; \theta) \text{ and } q_{2} = q_{2}^{R}(t; \theta).$$

 ∂t^R (

An Example

$$p=A-q_1-q_2$$
 and $mc_1=mc_2=0$

 $q_1^R(t; \theta) > 0$ and $q_2^R(t; \theta) > 0$, if $\underline{t} < t < \overline{t}$; where $\underline{t} < 0$ and $\overline{t} > 0$

$$t^{R}(\theta) = \frac{A(1-\alpha)\left(3-5\alpha\theta+\alpha^{2}\theta\right)}{\left(1-\alpha+\alpha\theta\right)\left(9-\alpha-10\alpha\theta+2\alpha^{2}\theta\right)}; \ \ \underline{t} < t^{R}(\theta) < \overline{t}$$

Trade Policy Intervention ...

۲

$$t^{R}(\theta) < 0$$
, if $\frac{1}{2}(5 - \sqrt{13}) < \alpha < 1$ and $\frac{3}{(5 - \alpha)\alpha} < \theta \le 1$
 ≥ 0 , otherwise
• If $\alpha = 0$ (No IPR), $t^{R}(\theta) > 0$

•
$$\frac{\partial t^{\kappa}(\theta)}{\partial \theta} < 0$$
 for all $\alpha \in (0,1)$ and $\theta \in [0,1]$.

Optimal rate of import tariff crucially depends on both the strength of the patent and the type of the damage rule in place.

Proposition 3

In the case of linear demand function and symmetric firms with constant marginal cost of production, the following is true.

(a) If the patent is strong ($\hat{\alpha} < \alpha < 1$), it is optimal for the importing country to impose a tariff on imports under 'lost profit' damage rule, but import subsidization is optimal under 'unjust enrichment' damage rule.

(b) If the patent is weak ($0 \le \alpha < \hat{\alpha}$), imposition of import tariff is optimal regardless of the damage rule, but 'lost profit' damage rule calls for a higher rate of import tariff than that under 'unjust enrichment' damage rule.

イロト 不得下 イヨト イヨト

Trade Policy Intervention ...

Intuitions

a) UE rule ($\theta = 1$): Foreign firm \mapsto collusive, but domestic firm \mapsto aggressive

b) LP rule ($\theta = 0$): Foreign firm \mapsto aggressive, but domestic firm \mapsto collusive

[Higher θ] \longrightarrow [Foreign firm more collusive, but domestic firm more aggressive]

 $\uparrow t \longrightarrow \downarrow q_1, \uparrow q_2, \downarrow (q_1 + q_2), \downarrow CS, \downarrow \pi_1, \uparrow \pi_2, \uparrow TR$

$$\theta = 0$$
: $SW = CS + (\pi_2 + \alpha \pi_1 - \alpha \pi_1^M) + TR$

 $\theta = 1$: $SW = CS + (1 - \alpha)\pi_2 + TR$

$$\begin{aligned} q_{1,UE}^R &> q_{1,LP}^R \text{ and } q_{2,UE}^R > q_{2,LP}^R \Rightarrow CS_{UE}^R > CS_{LP}^R \\ t_{UE}^R &< t_{LP}^R \text{ and } T_{UE}^R < T_{LP}^R \\ O_{1,UE}^R &> O_{1,LP}^R, \text{ but } O_{2,UE}^R < O_{2,LP}^R \\ SW_{UE}^R &< SW_{LP}^R. \end{aligned}$$

Proposition 4

In the regime of trade policy intervention, when the demand function is linear and firms have the same constant marginal cost of production, given the choice **the government of the home country would always enforce the 'lost profit' damage rule to be followed in the court of law**, which best protects interests of the infringer at the cost of both consumers and the patentee.
